## Seabirds

Many birds depend on the sea for their food. Wading birds, penguins, gulls and pelicans hunt and eat fish and other sea creatures.

Wading birds, such as oystercatchers, live and feed along the shore. Long, spindly legs help them to wade through shallow water. Their thin beaks dig around for small animals in the water and mud.

Out over the deeper ocean, birds need to be able to fly for a long time. The albatross has very long wings so that it can glide for hours. These seabirds dive into the water to catch their food.

Penguins cannot fly at all. They use their flippers and their webbed feet to swim very fast and catch fish.

All seabirds nest on land. Some nest on cliffs to be safe, laying their eggs in rocks. While some build nests from sticks, or seaweed and even mud.
