Fractions – equivalent fractions

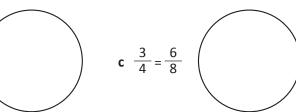

Equivalent fractions have the same value but they have different numerators and denominators. This means they have been divided into a different number of parts.

	:	1	
1 2	_		1/2
1/3	!	<u>1</u> 3	1/3
1/4	1/4	1/4	1/4
$\frac{1}{6}$ $\frac{1}{6}$! 1	<u>1</u>	$\frac{1}{6}$ $\frac{1}{6}$
$\frac{1}{8}$ $\frac{1}{8}$	1/8	$\frac{1}{8}$ $\frac{1}{8}$	$\frac{1}{8}$ $\frac{1}{8}$

- Use the wall to find the equivalent fractions:
 - a What fractions can you find that are equivalent to $\frac{2}{3}$?
 - **b** What fractions can you find that are equivalent to $\frac{3}{4}$?
 - c How many eighths are equivalent to $\frac{1}{2}$?
 - **d** How many quarters are equivalent to $\frac{4}{8}$?
 - e Divide the bottom row into twelfths. Find some equivalent fractions for $\frac{4}{12}$
- Divide and shade the shapes to show the following equivalent fractions. The first one has been done for you.

a
$$\frac{1}{2} = \frac{2}{4}$$

b
$$\frac{1}{4} = \frac{2}{8}$$

d
$$\frac{1}{2} = \frac{2}{4}$$

$$e^{-\frac{1}{4} = \frac{2}{8}}$$

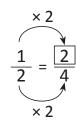

1

Fractions – equivalent fractions

To find equivalent fractions without drawing diagrams we use the numerators and denominators to guide us.

Imagine your share of a cake is half. It is too big to pick up so you cut your half into halves. You now have 2 quarters of the cake. So you can see that 2 quarters are equivalent to 1 half.

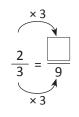

You have doubled the number of parts (the denominator) and by doing this you have doubled the number of parts (the numerator).

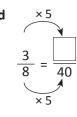

This method can be used to find all equivalent fractions. Whatever you do to the numerator, you do the same to the denominator, and vice versa.

Use the clues to help you make the equivalent fractions:

$$e^{-\frac{1}{3}} = \frac{1}{9}$$

$$f = \frac{1}{4} = \frac{1}{8}$$

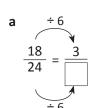

$$g = \frac{3}{4} = \frac{15}{1}$$

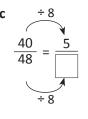

h
$$\frac{2}{4} = \frac{2}{2}$$

Whatever we do to the

top, we do to the bottom. Whatever we do to the bottom, we do to the top.

We can also reduce the number of parts in a whole. We divide to do this:

CHECK

Answer the following:

a Cassie's table won a pizza for having the most table points at the end of term. There are 6 pupils at the table. What fraction of the pizza will they each receive?

b The pizza has been cut into 12 pieces. How many slices does each pupil get?

\Box	_	\neg
1		
1		

What is this as a fraction?

c Stavros reckons that because they got 2 slices they got more than they would have if the pizza had been cut into 6 pieces. Is he right? Explain your answer with words or diagrams.

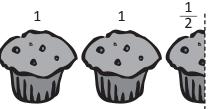

Fractions – mixed numbers and improper fractions

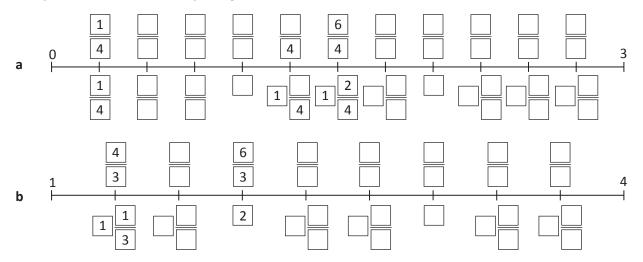

Mixed numbers are made up of whole numbers and fractions. $2\frac{1}{2}$ is a mixed number.

Mixed numbers can also be expressed as improper fractions. Improper fractions are fractions where the numerator is bigger than the denominator.

 $2\frac{1}{2}$ can also be written as $\frac{5}{2}$.

1 Complete the number lines by filling in the boxes:

Use the number lines above to help you find the mystery fractions. Score 5 points for a correct answer. Lose 3 points for a wrong answer. For some questions, more than 1 answer is correct. The first one has been done for you.

• •	•	•	•	• •	• •	•	• •	• •	•

- **Q1** This improper fraction is equivalent to 2.
- A1 $\frac{6}{3}$ or $\frac{8}{4}$
- **Q2** This improper fraction comes directly before $1\frac{2}{4}$.
- Δ2
- **Q3** This improper fraction is one third greater than $3\frac{1}{3}$.
- A3 _____
- **Q4** This mixed number is the same as $\frac{10}{4}$.
- A4 _____
- **Q5** This improper fraction is equivalent to 3.
- A5 _____

- **Q6** This mixed number comes directly after $\frac{9}{3}$.
- A6 _____
- **Q7** This improper fraction is equivalent to 4.
- A7 _____
- ${\bf Q8} \ \ {\bf This\ improper\ fraction\ is\ equivalent\ to\ 6}.$
- A8 _____
- **Q9** This improper fraction is equivalent to $2\frac{2}{3}$.
- A9 _____
- **Q10** This mixed number is one third less than $\frac{8}{3}$.
- A10 _____

Fractions – simplifying fractions

These fractions are all equivalent to one half: $\frac{1}{2}$ $\frac{2}{4}$ $\frac{6}{12}$ $\frac{75}{150}$ $\frac{3455}{6910}$

Which is the simplest? $\frac{1}{2}$

A fraction is in its simplest form when 1 is the only number that both numbers can be divided by. We simplify fractions to make reading and working with fractions easier.

Circle the simplest fraction in each group:

a
$$\frac{1}{2}$$
 $\frac{2}{4}$ $\frac{50}{100}$

b
$$\frac{33}{99}$$
 $\frac{3}{9}$ $\frac{1}{3}$

c
$$\frac{25}{100}$$
 $\frac{1}{4}$ $\frac{5}{20}$

d
$$\frac{2}{3}$$
 $\frac{6}{9}$ $\frac{16}{24}$

To find the simplest fraction, we divide both the numerator and the denominator by the same number. It makes sense for this to be the biggest number we can find so we don't have to keep dividing. This number is called the Highest Common Factor (HCF).

Look at:

$$\frac{6}{18} = \frac{?}{?}$$
 What is the biggest number that goes into both 6 and 18?
6 is the biggest number that goes into 18 and 6.

$$\frac{6}{18 \div 6} = \boxed{\frac{1}{3}}$$

Find the highest common factor and then simplify:

a
$$\frac{15}{20}$$
 HCF is $\longrightarrow \frac{15}{20} \div = \bigcirc$

b
$$\frac{9}{30}$$
 HCF is $\longrightarrow \frac{9}{30} \div = \bigcirc$

c
$$\frac{16}{24}$$
 HCF is $\longrightarrow \frac{16}{24} \div \bigcirc = \bigcirc$

d
$$\frac{12}{36}$$
 HCF is $\longrightarrow \frac{12}{36} \div = \bigcirc$

Wally says he has simplified these fractions as far as he can. Is he right? If not, find the simplest fraction:

$$a \ \frac{16}{20} \longrightarrow \frac{8}{10}$$

$$\mathbf{b} \quad \frac{50}{100} \longrightarrow \frac{25}{50} \longrightarrow \frac{5}{10}$$

$$c \xrightarrow{24} \longrightarrow \frac{4}{6}$$

$$d \frac{15}{20} \longrightarrow \frac{3}{4}$$

Fractions – simplifying fractions

Write the following fractions in their simplest form:

a
$$\frac{28}{49} = \frac{}{}$$

b
$$\frac{12}{20} = \frac{}{}$$

c
$$\frac{24}{42} = \frac{}{}$$

d
$$\frac{13}{39} = \frac{}{}$$

$$e \frac{32}{36} = \frac{}{}$$

$$f = \frac{9}{15} = \frac{}{}$$

g
$$\frac{16}{48} = \frac{}{}$$

h
$$\frac{15}{55} = \frac{}{}$$

If you are not sure what the HCF is, guess, check and improve is a useful strategy. Try your choice out and then look at your new fraction.

Could it be any simpler? Is 1 the ONLY number that could go into both the numerator and the denominator?

- Solve the following problems. Write your answers in the simplest form:
 - a Luke scored $\frac{16}{20}$ on a test. What fraction was incorrect?
 - **b** Marika scored $\frac{12}{20}$ on the same test. What fraction did she get right?
 - c 25 out of the 75 pupils in Year 6 ride their bikes to school. What fraction does this represent?
 - **d** Out of the 26 pupils in 6F, 14 rate Maths as their favourite subject. What fraction is this?
 - **e** What fraction did not choose Maths as their favourite subject?
- 6 Colour and match the fractions on the bottom row with their simplest form:

Fractions – comparing and ordering fractions

Comparing and ordering fractions with like numerators and denominators is a simple process:

When the denominators are different, we need to change the fractions so they have the same denominator. This lets us compare like with like.

Which is larger? $\frac{3}{4}$ or $\frac{5}{8}$

To convert quarters to eighths we double the denominator and numerator, so $\frac{3}{4}$ becomes $\frac{6}{8}$. $\frac{6}{8}$ is larger than $\frac{5}{8}$, so $\frac{3}{4}$ is larger then $\frac{5}{8}$.

Order these fractions:

 $1\frac{1}{2}$ $\frac{5}{4}$ $\frac{3}{4}$ $\frac{2}{4}$ $1\frac{3}{4}$ $\frac{1}{4}$ $\frac{4}{4}$

Hmm ... I had better make the mixed numbers into improper fractions as well. That will make them easier to compare.

THINK

Rename a fraction in each group so that you can compare them more easily. Circle the larger fraction:

a $\frac{1}{2}$ $\frac{2}{8}$ **b** $\frac{4}{8}$ $\frac{3}{4}$ **c** $\frac{2}{6}$ $\frac{1}{2}$ **d** $\frac{10}{12}$ $\frac{3}{4}$

Write or draw a fraction on the left that would result in the scale looking like this:

Remember with equivalent

fractions, we think about what we did to get from one to the other:

REMEMBER

Fractions – comparing and ordering fractions

4 Find a partner to play this game with:

Name a fraction between 0 and 1 and place it on the number line. Your partner then has to name and place a fraction that fits between that fraction and 1. Then you have to find one that fits between their fraction and 1 and so on. The game continues until one player cannot think of a fraction, or can't fit one in.

You can challenge a fraction placement. If you are right, your partner has to remove their fraction. If you are wrong, they get to do the 'told you so' dance.

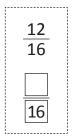

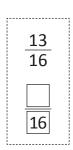

These fractions are all out of order. Cut them out and put them in order from smallest to largest. Place any equivalent fractions on top of each other. There is a space for you to rename the fractions on each of the cards if this will help. Share your thinking with a partner.

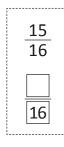

Have they ordered them the same way?

Fractions – renaming and ordering fractions

Sometimes we have to order and compare fractions with different numerators and denominators such as $\frac{1}{4}$, $\frac{1}{6}$ and $\frac{1}{5}$.

To do this, we have to find one common denominator for all the fractions.

a Continue cutting the cakes so that each cake has the same number of fair slices:

b If you had one of these new slices, what fraction of the cake would you receive?

That is an example of how we rename fractions. We find a way to re-divide the wholes so that they have the same number of parts. To do this efficiently we find the smallest shared multiple. This is then called the Lowest Common Denominator (LCD):

- The multiples of 2 are 2, 4, **6**, 8, ...
- $\frac{1}{3}$ The multiples of 3 are 3, **6**, 9, 12, 15, ...

6 is the LCD so we convert both fractions to sixths:

- Rename these fractions by first finding the shared LCD and then converting the fractions. Use the multiplication table on the right to help you find the LCD:

× 2	× 3	× 4	× 5	× 6
2	3	4	5	6
4	6	8	10	12
6	9	12	15	18
8	12	16	20	24
10	15	20	25	30
12	18	24	30	36
14	21	28	35	42
16	24	32	40	48
18	27	36	45	54

Fractions – renaming and ordering fractions

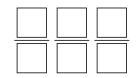

Look at each group of fractions. Predict which you think is the largest and circle your prediction. Now, rename the fractions in the work space below so that each fraction in the group has the same denominator. Use a different colour to circle the largest fraction. Are there any surprises?

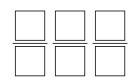

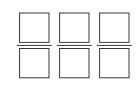

b
$$\frac{2}{5}$$
 $\frac{1}{2}$ $\frac{1}{3}$

$$\frac{3}{4}$$
 $\frac{2}{3}$ $\frac{4}{8}$

d
$$\frac{3}{4}$$
 $\frac{3}{6}$ $\frac{3}{8}$

This time, rename the fractions and circle the largest. Underline the smallest.

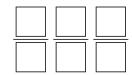

a
$$\frac{3}{8}$$
 $\frac{2}{4}$ $\frac{5}{6}$

a
$$\frac{3}{8}$$
 $\frac{2}{4}$ $\frac{5}{6}$ **b** $\frac{4}{7}$ $\frac{1}{2}$ $\frac{11}{14}$ **c** $\frac{1}{3}$ $\frac{5}{8}$ $\frac{4}{6}$ **d** $\frac{3}{4}$ $\frac{2}{3}$ $\frac{1}{2}$

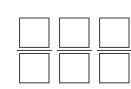

c
$$\frac{1}{3}$$
 $\frac{5}{8}$ $\frac{4}{6}$

$$\frac{3}{4} \quad \frac{2}{3} \quad \frac{1}{2}$$

	$\overline{1}$	

For each fraction write a larger fraction below. The new fraction must have a different denominator. It can have a different numerator.

If you can do this, you are a whiz! This is real extension Maths.

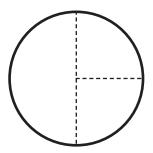

In this activity you will solve money problems. Working backwards is a useful working strategy to use here.

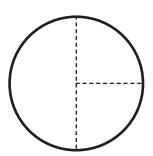

Use the fraction pies to help you solve the following problems:

Sarah's gran gave her some money for her birthday. Sarah saved $\frac{1}{2}$ of the money and spent $\frac{1}{4}$ of the money on a book. That left her with £15 in her purse. How much money did her Gran give her?

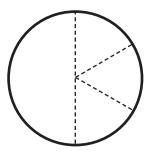

Martha opened her piggy bank and decided to spend it this way: $\frac{1}{2}$ on magazines; $\frac{1}{4}$ on snacks; $\frac{1}{4}$ on a necklace. The necklace cost £12. How much money did she have in her piggy bank?

All went to the show. He spent $\frac{1}{2}$ of his money on rides and $\frac{1}{3}$ of what was left on a hot dog, some chips and some candy floss. That left him with £28 to spend on show bags. How much money did he have to begin with?

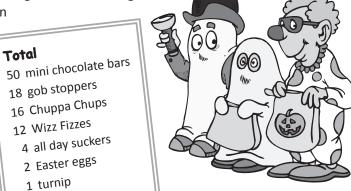

Sam and his mates decide to go trick or treating one Halloween. They then

divvy up the loot.

Use the chart on the right to work out the answers to the problems below:

- a In the opening round, Sam gets $\frac{2}{5}$ of the mini chocolate bars and $\frac{1}{4}$ of the Chuppa Chups. How many of each does he get?
- **b** George wanted all the gob stoppers. In a tense negotiation with Sam, he managed to score $\frac{2}{3}$ of them. How many did he get? How many did he miss out on?
- **c** To get his share of the gobstoppers, Sam has to trade off $\frac{1}{2}$ of the Chuppa Chups he received in Question **a**. How many does he lose?
- **d** Mara gets all the Wizz Fizzes, $\frac{1}{2}$ the all day suckers, and the remaining $\frac{3}{5}$ of the chocolate bars. In total, how many items does she get?

- e Here is a fraction sentence that shows how the gob stoppers were shared: $\frac{1}{3} + \frac{2}{3} = \frac{3}{3}$ or 1 whole. Write the fraction sentence that shows how the chocolate bars were shared.
- f Mara decides to give $\frac{1}{4}$ of her Wizz Fizzes to George. Write the fraction sentence to show how many she has left. Now, write the sentence using whole numbers.

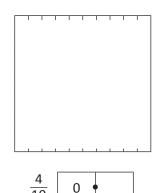

Decimal fractions – tenths, hundredths and thousandths

Common fractions and decimal fractions are related as they both show parts of a whole. In common fractions, we divide a whole into parts such as halves or sixths.

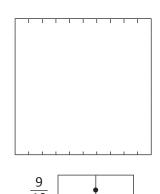

In decimal fractions, the whole is partitioned using the base 10 system – into tenths, then hundredths, then thousandths and so on.

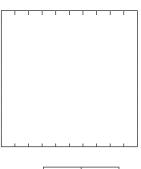

We use a decimal point after the ones number to indicate the end of whole numbers: 6.42 If the number has no whole numbers, we use a zero to make sure we don't miss the decimal point: 0.42

Divide these wholes into tenths and shade the specified amounts. Write each as a decimal fraction:

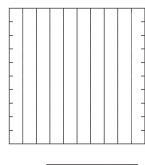

b

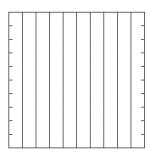

Now divide these wholes into hundredths and shade the specified amounts. Write each as a decimal fraction:

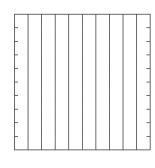

61 0 b

0

C

0

- **Express these as decimal fractions:**
 - **a** 6 tenths, 7 hundredths, 4 thousandths

- 4 tenths, 9 hundredths, 3 thousandths
- 0
- 0

- **e** 0 tenths, 2 hundredths, 9 thousandths
- 0
- 0

g 4 thousandths

- 0
- 1,000 1,000

Decimal fractions – reading and writing decimals

When we write decimals we follow this place order:

Thousands	Hundreds	Tens	Ones	Tenths	Hundredths	ns Thousandths	
			2	2	5	6	

Numbers **before** the decimal point are whole numbers.

Numbers after the decimal point are parts of a whole number.

The further the digit is to the left in the number, the greater its value. The further it is to the right, the smaller its value.

What is the value of the digit in bold?
Tick the correct column:

	Thousands	Hundreds	Tens	Ones	Tenths	Hundredths	Thousandths
a 5.8 9 2				•			
b 13.0 5							
c 7 63.22							
d 8 9 .021				•			
e 100.00 1							
f 560. 4 5				•			
g 3 1 2.956				•			

2	Read each number and write it as a decimal: a four ones, one hundred and twenty two thousandths			Watch out for the commas! They indicate the end of whole numbers.	
	b	one hundred and eleven, and sixty five hundred	ths		
	С	three hundred, and forty two thousandths	They indicate the end of whole numbers. I eleven, and sixty five hundredths and twelve hundredths I thirteen, and forty-three hundredths I thirteen, and forty-three hundredths I thirteen as 0.27 No it's not, it's written as Redths is written as 0.048 No it's not, it's written as		
	d	four thousand, and twelve hundredths			
	е	twelve, and 13 thousandths			
	f	two hundred and thirteen, and forty-three hund	Iredths	CHECK

	а	twenty seven tenths is written as 0.27	No it's not, it's written as		
	b	forty eight hundredths is written as 0.048	No it's not, it's written as		
	С	9000 thousandths is written as 0.009	No it's not, it's written as		
	d	eleven and 12 hundredths is written as 11.012	No it's not, it's written as		
	و	167 hundredths is written as 16.7	No it's not, it's written as		

Decimal fractions – comparing and ordering decimals

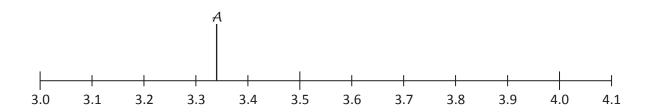

We need to carefully consider the place value of digits when ordering and comparing decimals.

1	6A has a very cool teacher who decides to harness,
	not ban, the class' current obsession with pea
	shooting. After a week of intense training, a shoot-
	off occurs. The results for the top ten shooters are
	tabled on the right.

	Name	Distance
A	Spitter Macgee	3.34 m
В	Did You See That One Big-noter	3.1 m
C	Secret-ingredient Spitski	3.15 m
D	Dead-eye Jones	3.63 m
B	The Long Distance Shooter	4.01 m
Sally Straw		3.36 m
G Technique Tezza		3.96 m
H Lone Shooter		4.04 m
D	Double Or Nothing Danielle	4.05 m
D	Shoot Dog	3.94 m

Place the pupils on the number line. The first one has been done for you.

2 Use the above information to answer the following questions:

a Who shot the furthest on the day?

.....

- **b** Whose shot was the shortest? ______
- c Which pupils' shots were 1 hundredth of a metre apart?
- **d** What was the difference between the shots of Shoot Dog and Spitter Macgee?
- **e** Do you think you could beat this? Something to try at home perhaps? Even 6A's teacher eventually had enough of the pea shooting.

Decimal fractions - rounding

We often round decimals to a particular place value. We do this to make the numbers easier to work with.

Look at 2.685. We can round this to the nearest whole number, tenth or hundredth.

Let's round it to the nearest tenth. To do this, we look at the number in the hundredths place. This is 8, which is closer to 10 than 1, so we round the tenth up. The rounded number is now 2.7

- Round these numbers to the nearest tenth:
 - **a** 67.23
- **b** 48.07 _____
- **c** 124.78 _____ **d** 90.14 _____
- **e** 54.53
- **f** 7.06
- If the rounding number is a 1 to 4, it rounds down. If it is 5 to 9, it rounds up.

Now round these numbers to the nearest hundredth:

- **a** 58.127 _____
- **b** 70.345 _____
- **c** 45.007 _____ **d** 78.134 _____
- **e** 89.036
- **f** 36.231 _____
- REMEMBER

Round the answers to the nearest tenth:

- **a** 301.25 (nearest 100th)
- = _____ **b** 4.99 (nearest 100th) = _____
- **c** 67 (nearest whole number) = _____ **d** 6,809.07 (nearest 100th) = ____

Look at the following meal options.

a Round each price to the nearest pound and total the estimated cost of each option below:

Choice 1		
Hamburger	£4.95	
Can of drink	£2.25	
Large chips	£1.15	
	Total	

Choice 2		
Jacket potato with cheese	£7.95	
Hot chocolate	£0.95	
Salad	£2.98	
	Total	

Choice 3			
	Salad roll	£5.15	
1	Juice	£2.25	
	Biscuit	£1.95	
		Total	

b You have £10. Circle the choices you can afford.

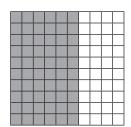

Decimal fractions – percentages

Percent comes from the Latin 'per centum' and means parts per hundred. It is expressed using the symbol %.

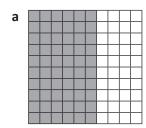

Here, 60% has been shaded. This is the same as 60 hundredths.

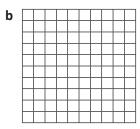

$$\frac{60}{100} = 0.60 = 60\%$$

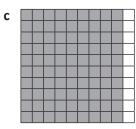

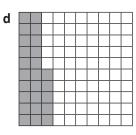

Fill in the missing values:

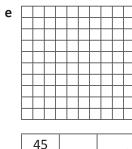

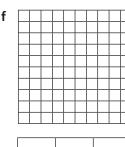

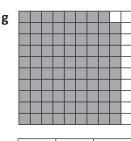

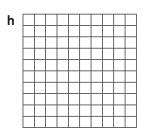

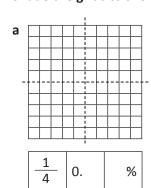

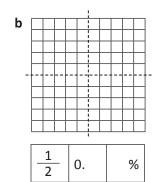

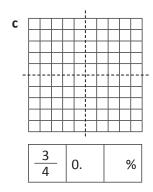

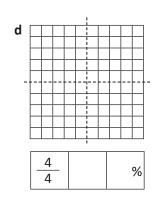

It is useful to know some common percentages such as 25%, 50%, 75% or 100%.

Shade the grids to show the following percentages:

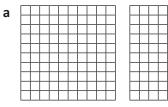

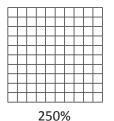

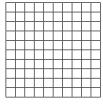

Decimal fractions – percentages

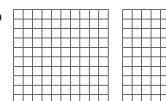

Not all percentage values are whole numbers between 1 and 100. We can have such things as 300% growth or percentages that contain decimals such as 3.5%.

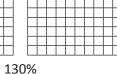

Shade the grids to show the following percentages:

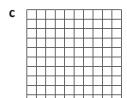

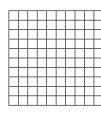

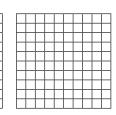

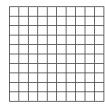

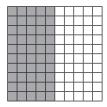

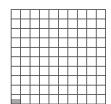

375%

How would you show half a percent? Circle the option you think is correct. Discuss your choice with a partner. Do they agree?

Option A

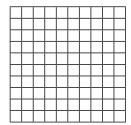

Option B

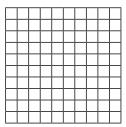

100 people were surveyed. They were asked to nominate their preferred way of eating vegetables. Shade the grids to show the survey results:

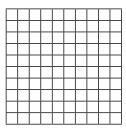

a 7% preferred their veggies boiled till they were all soggy and watery.

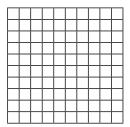

b 43% preferred their veggies stir fried.

c 19.5% preferred their veggies raw.

d 30.5% did not care how they were prepared because they weren't going to eat them anyway.

17

Ask around ... apply

In this activity you are going to design a survey and then ask 100 people your questions. You will then find a way to communicate your results.

Work in a small group.

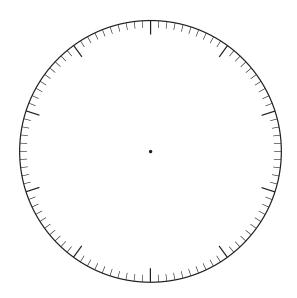

As a group, think about what information you are going to gather. Some things to consider might be:

- What kind of answers are you after?
- Will you provide options? How many? What if someone gives an answer you haven't included in your list? What if you get 100 different answers?
- Who is your target audience and when will you ask them? If you are surveying pupils about their favourite ice cream flavours, asking at lunch times would be a good time. If you want adult responses, when is the best time to be able to talk to 100 adults?
- How will you record the answers?

Plan your survey and run it by your teacher. If it all looks good, conduct it.

Use a pie graph to represent your information. You may use this model below or create your own using a spreadsheet program.

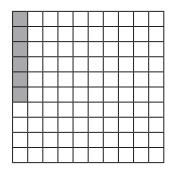

We have been using 100 grids to represent percentage, with each square representing 1%.

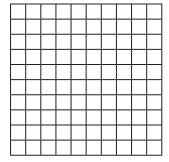

These grids are set up a little differently. Work with a partner to figure out what each square represents and then answer the questions.

Problem 1

These 6 squares have a value of 36.

- **a** What is the value of 1 square?
- **b** What is the value of the entire grid?
- **c** If 50% of the grid is shaded, what value is shaded?

Problem 2

There are 140 corner shops in Smallville.

- a 40% of these stock your favourite Slush Puppy flavour. Use the grid to represent this information.
- **b** How many stores sell your favourite flavour?

300 people

Problem 3

- a If this grid represents 300 people, what does each square represent?
- **b** How many people are represented by ten squares?
- **c** 60 of the 300 people like watching sports. Represent this on the grid in red.
- **d** 225 people prefer playing sport to watching it. Represent this in green.

Fractions of an amount – finding fractions

What process do we use to find fractions of amounts?

When we find $\frac{1}{4}$ of 20, we are sharing 20 into 4 groups. We use **division** to find fractions.

Warm up with this puzzle. Use division to find the answer to each clue. The solved puzzle will tell you the name of a very important day of the year.

$$L = \frac{1}{4} \text{ of } 16$$
 $Y = \frac{1}{2} \text{ of } 100$ $A = \frac{1}{12} \text{ of } 96$

$$Y = \frac{1}{2}$$
 of 100

$$A = \frac{1}{12}$$
 of 96

$$D = \frac{1}{7}$$
 of 63

$$0 = \frac{1}{2}$$
 of 22

D =
$$\frac{1}{7}$$
 of 63 **O** = $\frac{1}{2}$ of 22 **S** = $\frac{1}{100}$ of 1,000

$$H = \frac{1}{4} \text{ of } 300$$
 $T = \frac{1}{11} \text{ of } 55$ $M = \frac{1}{3} \text{ of } 9$

$$T = \frac{1}{11}$$
 of 55

$$M = \frac{1}{3}$$
 of 9

$$W = \frac{1}{2}$$
 of 2

$$W = \frac{1}{2} \text{ of } 4$$
 $R = \frac{1}{4} \text{ of } 100$

Put this date in your diary! Tell

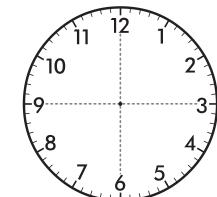

your friends!

We use fractions of time regularly in our lives. Use the clock to work out:

a What fraction of an hour is 15 minutes?

b What fraction of an hour is 30 minutes?

c What fraction of an hour is 45 minutes?

e If Lucas practises guitar from 4:20 to 4:35 each day, what fraction of an hour does this represent?

f Patrick practises football for 1 hr 15 min. How would you express that as an improper fraction?

g Find 3 time spans that represent $\frac{1}{3}$ of an hour.

_ to ______ to _____ to _____ to ____

Fractions of an amount – finding fractions

Once we know how to find one part of a group, we can use this to find other fractional amounts:

To find $\frac{2}{3}$ of 9, we first find $\frac{1}{3}$ of 9 \longrightarrow 9 ÷ 3 = 3 $\frac{1}{3}$ of 9 = 3

 $\frac{2}{3}$ of 9 is 2 times this $2 \times 3 = 6$ $\frac{2}{3}$ of 9 = 6

a
$$\frac{2}{4}$$
 of 12 =

b
$$\frac{5}{6}$$
 of 30 =

$$c = \frac{3}{4}$$
 of 24 =

d
$$\frac{3}{8}$$
 of 96 =

e
$$\frac{9}{10}$$
 of 20 =

$$f = \frac{3}{5}$$
 of 350 =

- The Walsh children fight like cats and dogs over computer time and their dad has had enough. He has drawn up a schedule and says that if they don't stick to it, he will hide the keyboard till Christmas and cut off the internet. Help the children work out their daily allocation and save them from a fate worse than death:
 - a How many minutes does each child get each day?

Nina

Natasha

b How many minutes must Dylan spend studying?

c How many minutes will Nina spend on Mathletics?

Dylan gets twice as much time as Nina as he has more homework. $\frac{1}{2}$ of his time is to be spent on study, the other half is free time. Natasha gets $\frac{1}{4}$ of an hour more than Nina but 30 minutes less than Dylan. She must spend $\frac{2}{8}$ of her time practising her French. Nina gets $\frac{3}{4}$ of an hour each day.

Nina gets $\frac{3}{4}$ of an hour each day $\frac{1}{3}$ of this is to be spent on Mathletics, the rest

is free time.

d Express the time allocations as fractions of an hour:

Dylan

Nina

Natasha

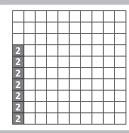

This one is a puzzle.
Read all the clues
carefully – one of them
is your starting point.
Once you have solved
that all important first
clue, the rest will follow.

Fractions of an amount – percentage

We often have to find percentages in real life such as '40% off – today only!'

40% of 100 is $\frac{40}{100}$ or 40. A £100 item would be reduced by £40.

That's easy if everything costs £100 but how do we find percentages of numbers other than 100? There are a number of ways to do this – here are some of them.

Look at this 100 grid. It represents the total cost of this phone which is £200. Each of the 100 squares represents 1% of this.

To find the value of a single square we divide: £200 \div 100 = £2

Each square or percent represents £2.

How do we then find 7% of £200? $7 \times £2 = £14$.

Use the 100 grid to calculate:

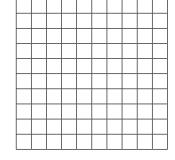

- **a** 5% of £200 is
- **b** 20% of £200 is
- **c** 10% of £200 is _____
- **d** 22% of £200 is _____
- **e** 15% of £200 is _____
- **f** 50% of £200 is _____

g If the store advertises a sale of 15% off the cost of the phone, what is the saving in pounds?______

Use the 100 grid to calculate the following. 1 square represents _____ people:

300 people

- **a** 8% of 300 people is ______ **b** 50% of 300 people is _____
- **c** 25% of 300 people is _____ **d** 40% of 300 people is _____
- **e** 12% of 300 people is ______ **f** 80% of 300 people is _____
- g If 65% of the 300 people surveyed liked chocolate, how many people liked chocolate?

Patterns can also help us understand percentages. Use patterns to calculate. The first row has been done for you.

.....

10% of 40 is4	5% of 40 is2	20% of 40 is8
10% of 50 is	5% of 50 is	20% of 50 is
10% of 60 is	5% of 60 is	20% of 60 is
10% of 100 is	5% of 100 is	20% of 100 is
10% of 500 is	5% of 500 is	20% of 500 is
10% of 1,000 is	5% of 1,000 is	20% of 1,000 is
10% of 3 000 is	5% of 3 000 is	20% of 3,000 is

Fractions of an amount – percentage

We can use fractions to help us calculate percentages.

How can we calculate 25% of 80?

We know that 25% is the same as $\frac{1}{4}$. To find $\frac{1}{4}$ of 80 we divide by 4.

$$80 \div 4 = 20$$

Use your knowledge of fractions to calculate the percentages:

a 25% of 120 is

$$\frac{1}{4}$$
 of 120 = _____

d 25% of 16 is

b 50% of 250 is

$$\frac{1}{4}$$
 of 120 = $\frac{1}{2}$ of 250 = $\frac{1}{2}$

c 20% of 50 is

$$\frac{1}{5}$$
 of 50 = _____

Calculators are also handy for working out percentages. This is how we calculate 40% of 50:

We enter

Ū

Our answer appears

Use a calculator to find these percentages:

The answer is 75. Use a calculator to work out the percentages and tick all the squares that match the answer:

What is 25% of 300?	What is	What is	What is
	75% of 100?	10% of 750?	15% of 55?
What is	What is	What is	What is
45% of 180?	35% of 300?	50% of 150?	20% of 375?

23

Fractions of an amount – ratio and proportion

A ratio is a comparison between two different things.

There are three red squares and one blue square, so we can say that the ratio of red squares to blue is 3 to 1. This can be written as 3:1. The order of the numbers follows the order of the words. The ratio of blue to red squares is 1 to 3 or 1:3.

You can also express ratios in relation to a total as a fraction. There are a total of four squares. Therefore, the ratio of red squares to the total is $\frac{3}{4}$. The ratio of blue squares to the total is $\frac{1}{4}$.

We can sometimes simplify ratios. Two of the squares are green and four are white, so the ratio of green to white is 2:4. Both sides of this ratio can be divided by 2 so it can be simplified to 1:2. For every one green square there are two white squares.

green	white	white
green	white	white

If two ratios are the same, we say they are in proportion. 2:4 and 1:2 are in proportion. The ratio of green blocks to the total number of blocks as a fraction is $\frac{2}{6}$. This can be simplified to $\frac{1}{3}$, so $\frac{2}{6}$ and $\frac{1}{3}$ are in proportion.

Complete the following word problems:

- a There are 17 boys and 13 girls in a class. Express the ratio of boys to girls in the form a:b, and the ratio of girls to the total number of children in the class as a fraction:
- b There are 15 sweets in a bag. 8 are red and the rest are green. Express the ratio of green to red sweets in the form a:b, and the ratio of green to the total number of sweets as a fraction:
- c In a litter of 8 kittens a quarter are tabby and the rest are black and white. Write the ratio of tabby to black and white cats in the form a:b, and ratio of tabbies to the total as a fraction:

Circle the pairs of ratios that are in proportion:

$$\frac{2}{7}$$
 and $\frac{4}{14}$

$$\frac{1}{3}$$
 and $\frac{2}{5}$

$$\frac{3}{4}$$
 and $\frac{6}{10}$

Fractions of an amount – ratio and proportion

I have a recipe for making 20 cup cakes, but I want to make 60 cakes. How much of each ingredient will I need?

For 20 cup cakes

3 cups flour

1 teaspoon salt

2 teaspoons baking powder

 $\frac{1}{2}$ cup butter

 $\frac{3}{4}$ cup sugar

2 eggs

1 cup milk

For 60 cup cakes

cups flour

teaspoons salt

teaspoons baking powder

cups butter

cups sugar

eggs

cups milk

These two Indian flags are in proportion. (They are not drawn to scale.)

a The length of the smaller one is 30 cm. The ratio of the smaller to the larger is 1:2. How long is the larger one?

b The larger flag is 40 cm high. How high is the smaller flag?

- These drawings are in proportion (but not to scale).
 - **a** What is the ratio of the smaller to larger car in form a:b?

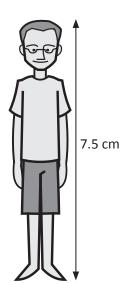

b The ratio of the smaller to the larger man is 1:4. How tall is the larger man?

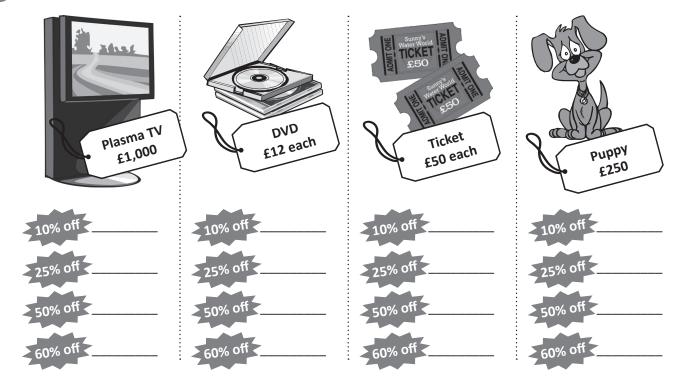

25

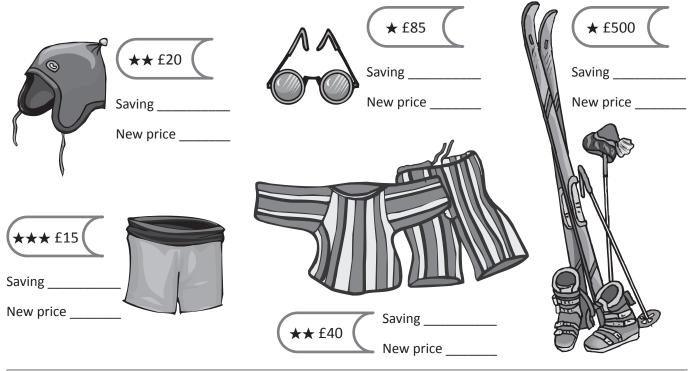

Fractions of an amount – finding discounts

We have to calculate discounts quite often in real life. Stores have many special offers and canny consumers can quickly calculate the savings to help them make decisions about their purchases.

1 How much would you save if the following discounts were offered? Choose a method to calculate:

You are helping your grandpa with his holiday shopping at Savers. Everything in the store marked ★ is 5% off, everything marked ★★ is 15% off and everything marked ★★★ is 20% off. Help your grandpa calculate both the savings and the new costs:

You are each going to fill your own shopping mall with things you like, then another group member will decide what kind of discounts you can have on each item.

Then you'll each race around your own shopping mall calculating the new prices.

You may keep any items you calculate correct prices for. You have to put back any mistakes!

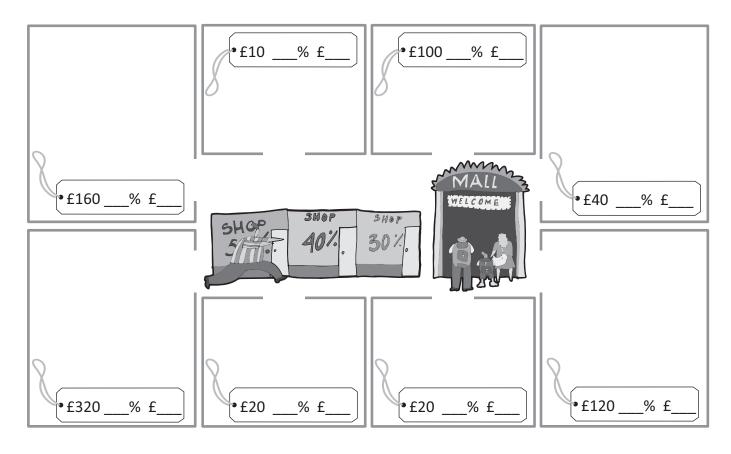

In each shop is a price tag. Next to each tag, draw something you think you'd like that would probably cost around this amount.

Now switch your paper with someone else in the group. Choose a discount of 5%, 10%, 20%, 25% or 50% to put next to the price. You must apply each discount at least once.

When everyone in your group is done, switch your pages back. On 'go', start calculating. Who finishes first? The game continues until everyone finishes their calculations.

Use a calculator to check everyone's maths. Who kept all their purchases? Excellent shopping.

Solve these shopping dilemmas. You can work with a partner or by yourself.

Show your mathematical reasoning for each problem.

You have been eyeing up a new pair of jeans available at your local jeans shop and also online. They are £100 at both suppliers.

In the sales, your jeans shop offers a discount of 20%, followed by a further reduction of 40% on the marked sale price. The online supplier offers a straight 60% discount.

Are these discounts the same? If not, which is the better deal?

Would you rather become 50% poorer and then 50% richer or become 50% richer and then 50% poorer?

DILEMMA 3 The new game you want costs £175 at one store and £180 at another. The first store then offers a discount of 5% while the second offers a discount of 10%.

Which deal gives you the cheapest price?

Calculating – adding and subtracting common fractions

How do we add or subtract fractions? Look at this example:

We had a movie marathon on the weekend. On Saturday, we watched movies for $7\frac{1}{4}$ hours and on Sunday we watched for $5\frac{1}{4}$ hours. How many hours did we spend watching movies in total?

$$7\frac{1}{4} + 5\frac{1}{4} =$$

First we add the whole numbers: 7 + 5 = 12. Then we add the fractions: $\frac{1}{4} + \frac{1}{4} = \frac{1}{2}$

Then we add the two answers together: $12 + \frac{1}{2} = 12 \frac{1}{2}$

We use the same process to subtract fractions.

1 Solve these problems:

$$a \frac{1}{3} + 2\frac{1}{3} =$$

b
$$2\frac{3}{4} - 1\frac{2}{4} =$$

c
$$1\frac{2}{5} + 3\frac{1}{5} =$$

d
$$\frac{1}{5}$$
 + 6 $\frac{2}{5}$ =

e
$$1\frac{3}{12} - \frac{1}{12} =$$

$$f 7\frac{4}{12} - 3\frac{2}{12} =$$

2 Express these as fraction sentences. Solve them:

a Sarah and Rachel go to a jumble sale. Sarah buys $3\frac{1}{4}$ boxes of jumble and Rachel buys $2\frac{1}{4}$ boxes of jumble. How much do they buy in total

b You have $2\frac{3}{4}$ boxes of chocolates and you eat $1\frac{1}{4}$ boxes. How many boxes do you have left?

c Before World Maths Day, Akhil practices Live Mathletics for $4\frac{1}{3}$ hours on Monday and $2\frac{1}{3}$ hours on Tuesday. How many hours of practice has he put in altogether?

d Aman really gets into a sport for a while then drops it and moves on to his latest craze. As a consequence, he has five and a half cupboards of old sports equipment. His mother makes him take some of it to the local charity shop. This leaves him with 2 full cupboards. How much has he taken to the shop?

3 What numbers could go in the boxes?

a
$$+ 1 = 5\frac{3}{4}$$

b
$$= 3\frac{1}{6}$$

Calculating – adding and subtracting common fractions

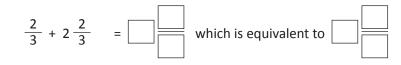

Look at this problem: $7\frac{2}{4} + 3 + \frac{3}{4}$

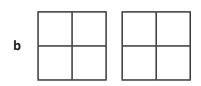

Our answer is $10 \frac{5}{4}$ which is a little confusing.

 $\frac{5}{4}$ is the same as $1\frac{1}{4}$. So let's add the 1 to our answer of 10. Our answer is now $11\frac{1}{4}$.

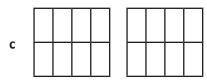

Solve these problems, converting any improper fractions in your answer to mixed numbers. You can use the models to help you with the renaming:

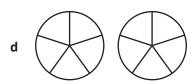

$$3\frac{2}{4} + 1\frac{3}{4} =$$
 which is equivalent to

$$7\frac{6}{8} + \frac{5}{8} =$$
 which is equivalent to

$$3\frac{3}{5} + 16\frac{3}{5} =$$
 which is equivalent to

Sometimes we also come across more complicated subtraction problems.

Look at $1\frac{1}{4} - \frac{3}{4}$. We can't take away $\frac{3}{4}$ from $\frac{1}{4}$ so we will need to rename.

 $1\frac{1}{4}$ is the same as $\frac{5}{4}$. $\frac{5}{4} - \frac{3}{4} = \frac{2}{4}$

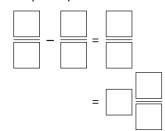

$$\frac{5}{4} - \frac{3}{4} = \frac{2}{4}$$

Use renaming to solve these problems. Convert your answers to mixed numbers. You can draw models if that helps:

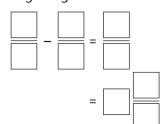

a
$$1\frac{2}{5} - \frac{4}{5} =$$

b
$$2\frac{2}{4} - \frac{3}{4} =$$

c
$$3\frac{2}{5} - \frac{4}{5} =$$

Calculating – adding and subtracting common fractions

Sometimes we need to add and subtract fractions that have different but related numerators and denominators.

Look at $\frac{3}{4} + \frac{1}{8}$ How do we do this? One way is to use fraction strips to find equivalent fractions.

We can see that $\frac{3}{4}$ is the same as $\frac{6}{8}$ $\frac{6}{8} + \frac{1}{8} = \frac{7}{8}$

$$\frac{6}{8} + \frac{1}{8} = \frac{7}{8}$$

		1			
	1/2			1/2	
1/3		1/3		1/3	
1/4	1 4		1/4	1/4	
<u>1</u> 5	<u>1</u> 5	<u>1</u> 5	<u>1</u> 5	<u>1</u> 5	
<u>1</u>	<u>1</u>	<u>1</u>	<u>1</u>	$\frac{1}{6}$ $\frac{1}{6}$	
<u>1</u> <u>1</u> 8	1/8	1/8	1/8	1/8	
$\frac{1}{10}$ $\frac{1}{10}$	$\frac{1}{10}$ $\frac{1}{10}$	$\frac{1}{10}$ $\frac{1}{10}$	$\frac{1}{10}$	$\frac{1}{10}$ $\frac{1}{10}$ $\frac{1}{10}$	
$\begin{array}{c cccc} \frac{1}{12} & \frac{1}{12} & \frac{1}{12} \end{array}$	$\frac{1}{12}$ $\frac{1}{12}$	$\frac{1}{12}$ $\frac{1}{12}$	$\frac{1}{12}$ $\frac{1}{12}$	$\begin{array}{c ccccccccccccccccccccccccccccccccccc$	-

Use the fraction strips above to help you add or subtract the like fractions. Rename the fractions in bold:

$$a \frac{1}{4} + \frac{1}{2}$$

$$b = \frac{2}{5} + \frac{6}{10}$$

$$c = \frac{4}{5} - \frac{2}{10}$$

$$d = \frac{4}{6} + \frac{2}{3}$$

$$e \frac{3}{4} - \frac{1}{2}$$

$$f = \frac{3}{4} + \frac{1}{8}$$

g Brad ate $\frac{2}{6}$ of a packet of crisps. Jen ate $\frac{2}{3}$ of a packet of crisps. How much did they eat altogether?

h Write a problem for a partner to solve:

Calculating – multiplying fractions by whole numbers

We can use repeated addition to multiply fractions by whole numbers.

$$3 \times \frac{2}{8}$$
 \longrightarrow 3 lots of two eighths is $\frac{2}{8} + \frac{2}{8} + \frac{2}{8} = \frac{6}{8}$

$$3 \times \frac{2}{8} = \frac{6}{8}$$

Use repeated addition to multiply these fractions. Show each of the steps:

a
$$3 \times \frac{3}{12}$$
 b $3 \times \frac{2}{7}$ **c** $5 \times \frac{1}{8}$ **d** $3 \times \frac{2}{9}$

$$= \frac{3}{12} + \frac{3}{12} + \frac{3}{12}$$

b
$$3 \times \frac{2}{7}$$

c 5 ×
$$\frac{1}{9}$$

d 3 ×
$$\frac{2}{9}$$

Try these. Convert your answers to whole numbers:

a
$$6 \times \frac{1}{2}$$

b
$$5 \times \frac{2}{5}$$

c 8 ×
$$\frac{2}{4}$$

a
$$6 \times \frac{1}{2}$$
 b $5 \times \frac{2}{5}$ **c** $8 \times \frac{2}{4}$ **d** $15 \times \frac{3}{5}$

Sam thinks that $6 \times \frac{2}{6}$ is the same as $5 \times \frac{2}{5}$. Is he right? Show how you know:

Sam's dad helped him with his homework. And we all know how that works out ... Here is what his dad did. Is he right? If not, explain to him where he went wrong.

$$3 \times \frac{3}{8}$$

$$\frac{3}{8} + \frac{3}{8} + \frac{3}{8} = \frac{9}{24}$$

$$3 \times \frac{3}{8} = \frac{9}{24}$$

32

Calculating – multiplying fractions by whole numbers

There is another way to multiply fractions by whole numbers. Look at 3 $\times \frac{3}{5}$.

We have 3 lots of three fifths. We can express this as $\frac{3 \times 3}{5} = \frac{9}{5}$

We don't multiply the fifths because these don't change – we still have fifths.

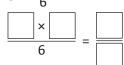

Multiply these fractions by whole numbers. Express the answers as improper fractions:

a
$$4 \times \frac{3}{4}$$

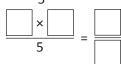

c 5 ×
$$\frac{2}{4}$$

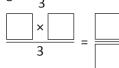

d
$$3 \times \frac{3}{6}$$

e 2 ×
$$\frac{4}{5}$$

$$f = 5 \times \frac{2}{3}$$

Our answers are all improper fractions. How do we convert these to mixed numbers? Look at $\frac{9}{4}$. This is nine quarters.

To change this to a mixed number we divide the numerator by the denominator:

9 ÷ 4 = 2 with 1 quarter left over. $\frac{9}{4}$ is the same as $2\frac{1}{4}$.

6 Warm up with these problems. There will be no remainders.

a
$$\frac{8}{4}$$

b
$$\frac{9}{3}$$

$$c = \frac{12}{6}$$

$$d = \frac{15}{5}$$

$$e^{\frac{16}{4}}$$

$$f^{-\frac{1}{2}}$$

$$g = \frac{8}{3}$$

$$h^{\frac{10}{5}}$$

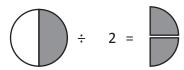

Now take your answers from Question 5 and write them here. Divide the numerators by the denominators to find their mixed number equivalents:

Calculating – dividing fractions by whole numbers

To divide a fraction by a whole number, you multiply the denominator (the bottom part) by the whole number. So,

$$\frac{1}{2}$$
 \div 2 = $\frac{1}{2 \times 2}$ = $\frac{1}{4}$

A half divided in two is a quarter:

Sometimes you might need to simplify the answer. For example,

$$\frac{2}{3}$$
 \div $2 = \frac{2}{3 \times 2} = \frac{2}{6} = \frac{1}{3}$

Solve these problems:

$$\mathbf{a} \quad \frac{1}{4} \div 2 = \boxed{}$$

b
$$\frac{1}{5} \div 3 = \frac{}{|x|} = \frac{}{|x|}$$

$$\mathbf{c} \quad \frac{1}{3} \div 4 = \boxed{} = \boxed{}$$

$$d \quad \frac{3}{4} \div 2 = \boxed{}$$

$$\mathbf{e} \quad \frac{3}{4} \div 3 = \boxed{} = \boxed{} = \boxed{}$$

$$\mathbf{f} \quad \frac{3}{5} \div 6 = \boxed{} = \boxed{} = \boxed{}$$

Fill in the missing numbers:

$$\mathbf{a} \quad \frac{1}{\boxed{}} \div 3 = \frac{1}{\boxed{}} \times 3 = \frac{1}{9}$$

b
$$\frac{1}{1} \div 4 = \frac{1}{16} \times 4$$

$$c \quad \frac{2}{7} \div \boxed{ } = \frac{2}{7 \times \boxed{ }} = \frac{2}{21}$$

d
$$\frac{5}{12}$$
 ÷ 2 = $\frac{5}{12}$ = $\frac{1}{12}$

$$\mathbf{e} \quad \frac{4}{\boxed{}} \div 4 = \frac{4}{\boxed{} \times 4} = \frac{4}{20} = \boxed{}$$

$$f \quad \frac{3}{4} \div \boxed{ } = \frac{3}{4 \times \boxed{ }} = \frac{1}{8}$$

Calculating – multiplying pairs of fractions

To multiply two fractions you multiply the numerators of both, then multiply the denominators. The calculation below is asking, 'What is a half of a third?'

$$\frac{1}{3} \times \frac{1}{2} = \frac{1 \times 1}{3 \times 2} = \frac{1}{6}$$

Sometimes you will need to simplify the answer.

$$\frac{2}{5} \times \frac{1}{4} = \frac{2 \times 1}{5 \times 4} = \frac{2}{20} = \frac{1}{10}$$

Solve these multiplication problems:

$$\mathbf{a} \quad \frac{1}{4} \times \frac{1}{3} = \boxed{ \times } = \boxed{ \times }$$

$$\mathbf{b} \quad \frac{1}{3} \times \frac{1}{5} = \boxed{} \times \boxed{} = \boxed{}$$

$$\mathbf{c} \quad \frac{1}{6} \times \frac{1}{3} = \boxed{ \boxed{ } \times \boxed{ }} = \boxed{ \boxed{ }}$$

$$\mathbf{d} \quad \frac{1}{7} \times \frac{1}{6} = \frac{ \times }{ \times } = \frac{}{}$$

Solve these multiplication problems and simplify the answers:

$$\mathbf{a} \quad \frac{2}{3} \times \frac{1}{6} = \boxed{\boxed{} \times \boxed{}} = \boxed{\boxed{}} = \boxed{\boxed{}}$$

$$\mathbf{b} \quad \frac{1}{3} \times \frac{3}{4} = \boxed{} \times \boxed{} = \boxed{} = \boxed{}$$

$$\mathbf{c} \quad \frac{2}{5} \times \frac{3}{4} = \boxed{} \times \boxed{} = \boxed{} = \boxed{}$$

$$d \quad \frac{3}{4} \times \frac{6}{7} = \boxed{ } \times \boxed{ } = \boxed{ } = \boxed{ }$$

Find the missing numbers in these multiplication problems:

$$a \frac{1}{4} \times \frac{1}{8} = \frac{1}{8}$$

b
$$\frac{2}{5} \times \frac{1}{5} = \frac{2}{15}$$

b
$$\frac{2}{5} \times \frac{1}{5} = \frac{2}{15}$$
 c $\frac{1}{3} \times \frac{1}{3} = \frac{1}{33}$

$$d \quad \frac{2}{5} \times \frac{\boxed{}}{4} = \frac{6}{\boxed{}} = \frac{3}{\boxed{}}$$

$$e \frac{3}{100} \times \frac{5}{6} = \frac{3}{30} = \frac{3}{100}$$

Calculating – multiplying decimals by 10, 100 and 1,000

When we multiply by 10 the number becomes larger by 1 place value.

When we multiply by 100 the number becomes larger by 2 place values.

When we multiply by 1,000 the number becomes larger by 3 place values.

Look what happens to 45.216 when we apply these rules:

 $45.216 \times 10 = 452.16$

 $45.216 \times 100 = 4,521.6$

 $45.216 \times 1,000 = 45,216$

Warm up with these. Work with a partner and a calculator. Predict your answers to the following then try out the problems. Your answers will be one or more of the following. The first one has been done for you.

tens

tenths

hundredths

ones

What place values are in your answers? Multiply by 10:

- We get 60, 30, 10 (tens) **a** these ones: 6, 3, 1
- **b** these tenths: 0.6, 0.3 and 0.1..... We get
- We get these hundredths: 0.06, 0.03 and 0.01
- **d** these ones and tenths: 1.6, 2.3 and 3.4 We get
- e these tenths and hundredths: 0.16, 0.23, 0.31 and 0.49. We get

Multiply these decimals by 10, 100 and 1,000. Estimate first.

	× 10	× 100	×1,000
0.5		50	
0.25	2.5		
0.37			370
1.2			
7.34		734	

Estimate, then calculate the answers:

36

Calculating – dividing decimals by 10, 100 and 1,000

When we divide by 10 the number becomes smaller by 1 place value.

When we divide by 100 the number becomes smaller by 2 place values.

When we divide by 1,000 the number becomes smaller by 3 place values.

Look what happens to 45 when we apply these rules:

$$45 \div 10 = 4.5$$

$$45 \div 100 = 0.45$$

$$45 \div 1,000 = 0.045$$

1 Divide these numbers by 10, 100 and 1,000. Estimate first.

	÷ 10	÷ 100	÷ 1,000
50	5		
25		0.25	
37.2			
48.5			0.0485
542			

2 Estimate, then calculate the answers:

- 3 You'll work with a partner for this activity. You'll also need a calculator. Take turns giving each other a decimal number to transform.
 - **a** Give them the starting number and the number you want it to become.
 - **b** Your partner then has to do so in one move on the calculator, dividing by either 10, 100 or 1,000.
 - **c** If they can do so, they score 10 points. If they get it wrong, you score 10 points. If you give them a problem that can't be solved by dividing by 10, 100 or 1,000, they score the 10 points.
 - **d** Swap roles. First person to 50 points wins. Record the numbers below:

OK, start with 163. Turn it into 1.63 in 1 move.

Calculating – multiplying decimal fractions

How do we multiply decimal fractions using a written strategy?

First we estimate: $5 \times 3 = 15$. Our answer will be around 15.

 3×5 tenths is 15 tenths. We rename this as 1 one and 5 tenths.

We write the 5 in the tenths column and move the one to the ones column.

 3×4 is 12. We also add the 1.

 $3 \times 4.5 = 13.5$

We check the answer against our estimate. Do they fit?

×			3	
	1	3	5	
		1		

5

Multiply these decimal fractions:

- a 2 . 6
 - × 2
- **b** 3 . 7
 - × 4

C

5 . 2 × 5

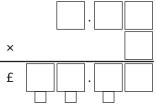

- ×
- **e** 1 4 . 5
 - × 3
- **f** 2 4 . 5
 - × 7

- Now try these:
 - а
- 3 . 2
- b
- 5 . 3 3
- C
- 8 . 4 2

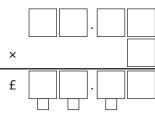

- × 4
- x 3
- ×

- 6 . 2 8
- f 3 . 4 5

- × 6
- × 4
- × 8
- 3 Use the templates to set up and solve these money problems:
 - a Yasmin buys 3 cartons of choc milk. Each carton costs £2.45. How much money does she spend?
- b Lisa buys 4 magazines. Each magazine costs £4.95. How much does she spend on magazines in total?

c Omar wants to buy 3 games for his computer. Each game is £14.95. He has saved £45. Does he have enough money?

G (4

Calculating – multiplying decimal fractions

We can also use renaming to multiply decimal fractions. Look at 4×3.6 :

4

3.6 can also be expressed as 36 tenths.

1 4 tenths

2

 $36 \times 4 = 144$

Then we convert back to decimals:

144 tenths is 14.4

Rename these decimal fractions then multiply. The first one has been started for you.

3 × 2.7 =	
	3 × 2.7 =

2 7

2.7 is 27 tenths

- $3 \times 2.7 =$
- Try these. These numbers have hundredths so we will rename the decimal fractions as hundredths. The first one has been done for you.

a
$$4 \times 6.12 = 24.48$$

6.12 is 612 hths

- 6 1 2
- $4 \times 6.12 = 24.48$

- Solve these problems:
 - **a** Danielle and her twin brothers are each 1.57 m tall. What is their combined height?

Unless there's a zero at the end, if I multiply tenths, I will always have tenths in my answer. If I multiply by hundredths, I'll always have hundredths in my answer. It's a good way to check that my answers are right.

b Your favourite chocolates are on special for £4.55 per box. You wait until your mum is in a weakened state and then masterfully convince her that buying 7 boxes is a great idea. How much will this cost?

Calculating – multiplying decimal fractions

You and your friends are going to the movies and it's your shout. Look at the price list below and use a multiplication strategy of your choice to answer the following questions. Show your thinking:

a How much will it cost you for 4 "Under 13" tickets?

b Two of your friends each want a large drink and a medium popcorn. What will that cost you?

Ticket Prices Under 13 £10.50 Adult £14.50 Refreshments Popcorn S £2.50 M £3.50 L £4.50 Drink S £2.50 M £3.00 L £3.50 Chocolate bar £1.95 Choc topped ice cream £3.25 Water £1.95 Crisps £2.95

c You and your other friend want a choc topped ice cream and a large drink each. What will that cost?

d Halfway through the movie, you are all dying of thirst and you go out and buy 4 bottles of water. You pay for them with a £20 note. How much change do you receive?

e Use the refreshment price list to design and calculate the cost of a snack that would help get you through this Maths lesson.

Calculating – dividing decimal fractions

Look at 64.4 divided by 5. We start with the largest place value.

6 tens divided by 5 is 1 ten with a remainder of 1 ten.

We rename this as 10 ones and carry it over to the ones column.

14 ones divided by 5 is 2 with 4 ones left over.

We rename this as 40 tenths and carry it. We now have 44 tenths.

44 tenths divided by 5 is 8 with a remander of 4. We rename this as

40 hundredths. 40 hundredths divided by 5 is 8.

64.4 divided by 5 is 12.88

Divide these:

- 8 8 5 . 6 **b** 5 4 7 . 0 **c** 7 5 8 . 1

- Sharing money is a time when we divide decimal fractions. Add the bills then divide them evenly among 4 people. Don't listen to the guy who said he only ate the rice – he's a cheapskate.

2 hot chocolates.....£5.60 2 milkshakes.....£4.20 2 muffins£5.80 1 large bowl chips£4.60 Total

1 sweet & sour chicken .. £ 9.50 1 king prawns with veg...£19.30 1 beef and broccoli......£12.50 1 large rice..... £ 3.30 4 colas£ 8.60 Total

Calculating – dividing decimal fractions

- Solve these decimal word problems using a mental or written strategy of your choice:
 - **a** You and 6 friends win a jackpot totalling £248.15. If you share the prize equally, how much will each of you receive?

b Two of these friends decide that money is the root of all evil and forgo their share. How much do you each receive now?

c To celebrate you go out and buy 5 ice creams, costing a total of £11.25. What was the cost of an individual ice cream?

You remember the answer is 6.125. But you have lost the question! You know it was a division problem and that you divided 2 whole numbers to get to the answer. Both the numbers were smaller than 60. But that's all you can remember. And your teacher wants to see what you have been doing during the lesson or you can kiss playtime goodbye.

Save your playtime and work out what the division problem was. You can try this with or without a calculator.

$$? \div ? = 6.125$$

See if you can guess the secret numbers below. You can use a calculator and ask a partner if you like.

- 1 I start with the number. I halve it, add 3.6 to that answer, divide this new number by 4 and then I add 0.3. My answer is 6.5. What number did I start with?
- 2 I start with a new secret number. I add 1.4 to this, divide the new number by 11, halve the quotient and then halve it again. My answer is 1.25. What number did I start with?
- 3 I start with a number, then halve it. I subtract 18.05 from the answer and then multiply this number by 3. I add 6 to the total and my answer is 96.3. What number did I start with?
- 4 I start with a number and divide it by 8. I multiply the answer by 3.2 and then subtract 4.1 from this new answer. I multiply this by 23 and end up with 52.9. What number did I start with?

Work backwards! You have to do the opposite process for each step.

Now you know how these work, can you write your own problem for a partner to solve?
